

CMOS linear image sensor

S13496

High sensitivity, photosensitive area with minute pixels

The S13496 is a high sensitivity CMOS linear image sensor using a photosensitive area with minute pixels. It has a long photosensitive area (effective photosensitive length: 28.672 mm) consisting of 4096 pixels, each with a pixel size of $7 \times 200 \mu \text{m}$.

Features

- Pixel size: 7 x 200 μm
- **4096 pixels**
- → Effective photosensitive area length: 28.672 mm
- \rightarrow High sensitivity: 650 V/($lx \cdot s$)
- Simultaneous charge integration for all pixels
- **→** Variable integration time function (electronic shutter function)
- **■** 5 V single power supply operation
- Built-in timing generator allows operation with only start and clock pulse inputs.
- Video data rate: 10 MHz max.

- Applications

- Position detection
- Image reading
- Encoders
- Spectrometers

Structure

Parameter	Specification	Unit
Number of pixels	4096	-
Pixel size	7 × 200	μm
Photosensitive area length	28.672	mm
Package	LCP (liquid crystal polymer)	-
Window material	Quartz	-

■ Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit
Supply voltage	Vdd	Ta=25 °C	-0.3 to +6	V
Clock pulse voltage	V(CLK)	Ta=25 °C	-0.3 to +6	V
Start pulse voltage	V(ST)	Ta=25 °C	-0.3 to +6	V
Operating temperature	Topr	No dew condensation*1	-40 to +65	°C
Storage temperature	Tstg	No dew condensation*1	-40 to +65	°C

^{*1:} When there is a temperature difference between a product and the surrounding area in high humidity environment, dew condensation may occur on the product surface. Dew condensation on the product may cause deterioration in characteristics and reliability.

Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

➡ Recommended terminal voltage (Ta=25 °C)

Parameter		Symbol	Min.	Тур.	Max.	Unit
Supply voltage		Vdd	4.75	5	5.25	V
Clock pulse voltage	High level	V(CLK)	3	Vdd	Vdd + 0.25	V
	Low level		0	-	0.3	V
Start pulse voltage	High level	\//CT\	3	Vdd	Vdd + 0.25	V
	Low level	V(ST)	0	-	0.3	V

Input terminal capacitance (Ta=25 °C, Vdd=5 V)

Parameter	Symbol	Min.	Тур.	Max.	Unit
Clock pulse input terminal capacitance	C(CLK)	-	5	-	pF
Start pulse input terminal capacitance	C(ST)	-	5	-	pF

■ Electrical characteristics [Ta=25 °C, Vdd=5 V, V(CLK)=V(ST)=5 V]

Parameter	Symbol	Min.	Тур.	Max.	Unit
Clock pulse frequency	f(CLK)	200 k	5 M	10 M	Hz
Video data rate	VR	-	f(CLK)	-	Hz
Output impedance	Zo	70	-	260	Ω
Current consumption*2 *3	Ic	20	40	60	mA

^{*2:} f(CLK)=10 MHz

■ Electrical and optical characteristics [Ta=25 °C, Vdd=5 V, V(CLK)=V(ST)=5 V, f(CLK)=10 MHz]

Parameter	Symbol	Min.	Тур.	Max.	Unit	
Spectral response range	λ		200 to 1000			
Peak sensitivity wavelength	λр	-	700	-	nm	
Photosensitivity*4	S	-	650	-	V/(lx·s)	
Conversion efficiency*5	CCE	-	25	-	μV/e⁻	
Dark output voltage*6	VD	0	0.1	2	mV	
Saturation output voltage*7	Vsat	1.5	2.0	2.5	V	
Readout noise	Nread	0.1	0.4	1.2	mV rms	
Dynamic range 1*8	DR1	-	5000	-	times	
Dynamic range 2*9	DR2	-	20000	-	times	
Output offset voltage	Voffset	0.3	0.6	0.9	V	
Photoresponse nonuniformity*4 *10	PRNU	-	±2	±10	%	
Image lag*11	Lag	-	-	0.1	%	

^{*4:} Measured with a tungsten lamp of 2856 K

Integration time=10 ms

Dark output voltage is proportional to the integration time and so the shorter the integration time, the wider the dynamic range.

*10: Photoresponse nonuniformity (PRNU) is the output nonuniformity that occurs when the entire photosensitive area is uniformly illuminated by light which is 50% of the saturation exposure level. PRNU is measured using 4090 pixels excluding 3 pixels each at both ends, and is defined as follows:

PRNU = $\Delta X/X \times 100$ (%)

X: average output of all pixels, ΔX : difference between X and maximum output or minimum output

*11: Signal components of the preceding line data that still remain even after the data is read out in a saturation output state. Image lag increases when the output exceeds the saturation output voltage.

^{*3:} Current consumption increases as the clock pulse frequency increases. The current consumption is 10 mA typ. at f(CLK)=200 kHz.

^{*5:} Output voltage generated per one electron

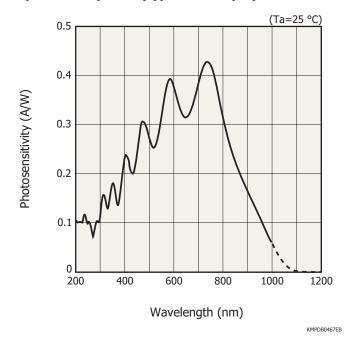

^{*6:} Integration time=10 ms

^{*7:} Diference from Voffset

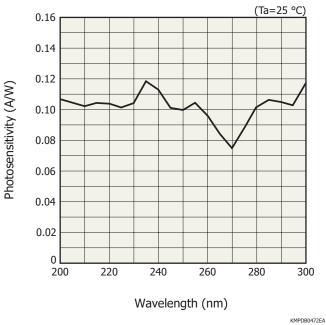

^{*8:} DR1 = Vsat/Nread

^{*9:} DR2 = Vsat/VD

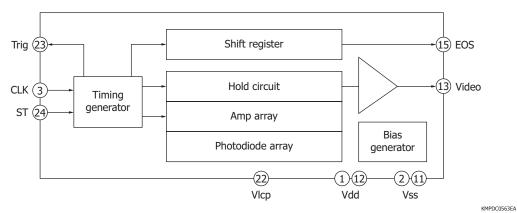

Spectral response (typical example)

Spectral response in UV (typical example)

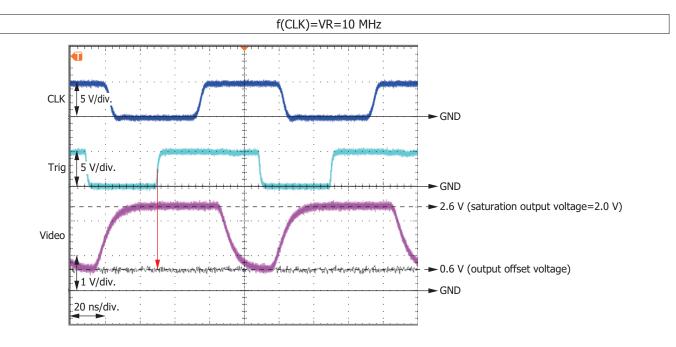

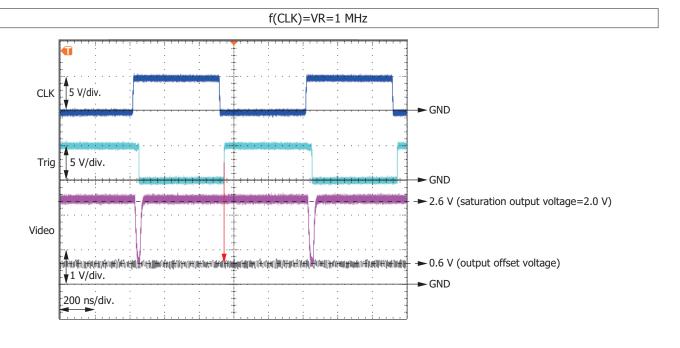

Block diagram

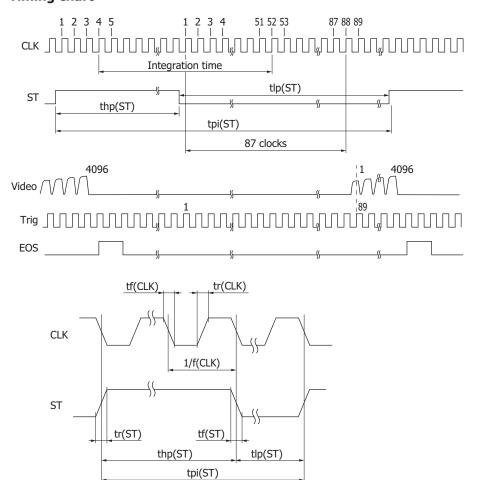

Output waveforms of one pixel

The timing for acquiring the Video signal is synchronized with the rising edge of Trig pulse (See red arrow below.).

- Timing chart

KMPDC0480EA

Parameter	Symbol	Min.	Тур.	Max.	Unit
Start pulse cycle*12	tpi(ST)	106/f(CLK)	-	-	S
Start pulse high period*12 *13	thp(ST)	6/f(CLK)	-	-	S
Start pulse low period	tlp(ST)	100/f(CLK)	-	-	S
Start pulse rise and fall times	tr(ST), tf(ST)	0	10	30	ns
Clock pulse duty ratio	-	45	50	55	%
Clock pulse rise and fall times	tr(CLK), tf(CLK)	0	10	30	ns

^{*12:} Dark output increases if the start pulse cycle or the start pulse high period is lengthened.

The shift register starts operation at the rising edge of CLK immediately after ST goes low.

The integration time can be changed by changing the ratio of the high and low periods of ST.

If the first Trig pulse after ST goes low is counted as the first pulse, the Video signal is acquired at the rising edge of the 89th Trig pulse.

^{*13:} The integration time equals the high period of ST plus 48 CLK cycles.

Operation example

This example assumes that the clock pulse frequency is maximized (video data rate is also maximized), the time of one scan is minimized, and the integration time is maximized

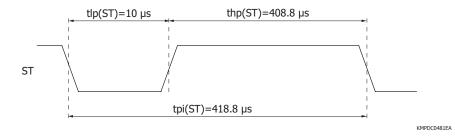

Clock pulse frequency = Video data rate = 10 MHz

Start pulse cycle = $4188/f(CLK) = 4188/10 \text{ MHz} = 418.8 \ \mu s$

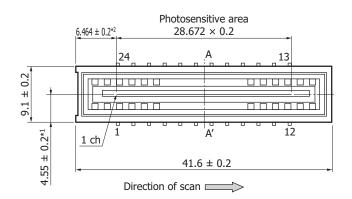

High period of start pulse = Start pulse cycle - Start pulse's low period min.

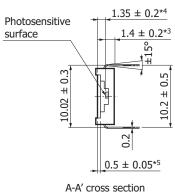

= $4188/f(CLK) - 100/f(CLK) = 4188/10 MHz - 100/10 MHz = 408.8 \mu s$

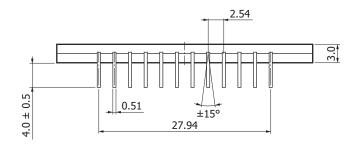

Integration time is equal to the high period of start pulse + 48 cycles of clock pulses, so it will be 408.8 + 4.8 = 413.6 µs.

Dimensional outline (unit: mm)

Tolerance unless otherwise noted: ±0.1

- *1: Distance from package edge to photosensitive area center
- *2: Distance from package edge to photosensitive area edge
- *3: Distance from package bottom to photosensitive surface
- *4: Distance from window upper surface to photosensitive surface
- *5: Glass thickness

8	NC	-	No connection	20	NC	-	No connection
9	NC	-	No connection	21	NC	-	No connection
10	NC	-	No connection	22	Vlcp	I	Bias voltage for negative voltage circuit*15
11	Vss	-	GND	23	Trig	0	Trigger pulse for video signal acqusition
12	Vdd	I	Supply voltage	24	ST	I	Start pulse

^{*14:} Connect a buffer amplifier for impedance conversion to the video output terminal so as to minimize the current flow. As the buffer amplifier, use a high input impedance operational amplifier with JFET or CMOS input.

Note: Leave the "NC" terminals open and do not connect them to GND.

- Application circuit example

^{*15:} Approximately -1.5 V generated by the negative voltage circuit inside the chip is output to the terminal. To maintain the voltage, insert a capacitor around 1 µF between Vlcp and GND.

CMOS linear image sensor

S13496

Precautions

(1) Electrostatic countermeasures

This device has a built-in protection circuit against static electrical charges. However, to prevent destroying the device with electrostatic charges, take countermeasures such as grounding yourself, the workbench and tools. Also protect this device from surge voltages which might be caused by peripheral equipment.

(2) Light input window

If dust or dirt gets on the light input window, it will show up as black blemishes on the image. When cleaning, avoid rubbing the window surface with dry cloth or dry cotton swab, since doing so may generate static electricity. Use soft cloth, paper or a cotton swab moistened with alcohol to wipe dust and dirt off the window surface. Then blow compressed air onto the window surface so that no spot or stain remains.

(3) Soldering

To prevent damaging the device during soldering, take precautions to prevent excessive soldering temperatures and times. Soldering should be performed within 5 seconds at a soldering temperature below 260 °C.

(4) Operating and storage environments

Always observe the rated temperature range when handling the device. Operating or storing the device at an excessively high temperature and humidity may cause variations in performance characteristics and must be avoided.

(5) UV light irradiation

This device is designed to suppress performance deterioration due to UV exposure. Even so, avoid unnecessary UV exposure to the device. Also, be careful not to allow UV light to strike the cemented portion of the glass.
